

AstroMesh — shot list

What to click, when, and what should be on screen. Pairs with *NARRATION.md*, which is the spoken half. Times are cumulative; treat them as pacing, not law.

Before you press record

	Check
1	Gateway running (node dev/mock-gateway.js) and frontend up
2	Browser at 1600×900 , zoom 100% , bookmarks bar hidden
3	Open the HOW tab once, then close it — this warms the corridor and ground layers so nothing stalls on camera
4	Open FILTERS → tick "Show all tracked objects" , wait for the catalogue, then untick — warms the GPU screen
5	Reload the page for a clean boot animation
6	Do one full dry run with wifi off — if it survives that, it survives the venue

Scene 1 · Cold open — 0:00 to 0:15

Do	Nothing. Let the boot animation and globe fly-in play.
On screen	Globe fills the right. Sidebar shows BLOCKED 44% .
Narration	"This is AstroMesh..." through "...complete, partial, blocked, or unresolved."
Watch for	Don't start talking over the boot bar. Let it land, then speak.

Scene 2 · The gate refuses — 0:15 to 0:50

Do	Click RISK in the rail. Wait for cards. Click VOTE on the top card.
On screen	Red toast: OPERATOR VOTE REFUSED. The rulebook fills the panel — red × rows, grey ○ rows.
Narration	<i>"Here is a real conjunction..." through "...is how accidents happen."</i>
Point at	The FR-07 row and its NO OVERRIDE tag. Then sweep the grey ○ rows.
Watch for	If the top card's objects are commandable, the refusal reason differs — read the reason on screen rather than the script's. The point survives either way.

This is the thesis scene. Slow down. Everything after is evidence.

Scene 3 · One event, every layer — 0:50 to 1:35

Do	Click HOW in the rail. The globe flies to the corridor and paints it. Scroll the panel slowly as you talk.
On screen	Red dispersion ribbon Spain → India, dashed centreline, DINOv3 ground strip, 12 numbered steps.
Narration	<i>"Now let me show you where a verdict comes from..." through "...ninety-four percent of the time."</i>
Pause on	Step 3 (Kp / density), step 5 (DINOv3), step 8 (Ec 19.7×), step 9 (the DAS comparison) .
Watch for	Scroll at reading speed. If you cut anything in the whole film, do not cut step 9.

Scene 4 · Ride it down — 1:35 to 2:00

Do	Click ► FOLLOW DESCENT (top-centre of the globe). Let it run ~12 s. Optionally hit ¼× as it crosses land.
On screen	Camera falls with the stage. HUD: altitude, flight-path angle, downrange, progress bar. Ground scrolls beneath.
Narration	<i>"This is the same descent, from the vehicle..." through "...says exactly that."</i>
Then	Click ✕ STOP FOLLOWING .
Watch for	Say the "kinematic replay" line while the caption is visible . Volunteering the limit is the point.

Scene 5 · The storm — 2:00 to 2:25

Do	Click STORMS in the rail. Click ⚡ REPLAY GANNON — 10 MAY 2024 .
On screen	Camera pulls back. Three bands paint: red polar caps, green auroral ovals, amber equatorial belt. Header flips to Kp 9 · G5. Panel: 3/8 ground stations reachable. Map key bottom-left.
Narration	<i>"May 2024. The Gannon storm..." through "...while you are deciding."</i>
Point at	The station count dropping, then the map key.
Then	Click LIVE to restore — the bands vanish. That before/after is worth the two seconds.

Scene 6 · Three domains — 2:25 to 2:45

Do	Still in STORMS , scroll to THEME INDEPENDENCE → click PROVE IT .
On screen	Five release-gate scenarios with all four state

	badges, and engine changes required: 0.
Narration	<i>"This challenge asked for a capability..." through "...where we needed this first."</i>
Watch for	The aircraft-dispatch rulebook is API-side (/api/portability/dispatch). Say it, don't hunt for it — if a judge asks, open the endpoint.

Scene 7 · GPU screen and close — 2:45 to 3:05

Do	Click FILTERS (bottom right) → ⚡ GPU SCREEN . Numbers land in about a second. Close FILTERS. Click HOW to end on the signal.
On screen	31,551 objects · ~497M pairs · N ms · B pair-checks/s on your GPU, then candidate lines flash on the globe.
Narration	<i>"One last thing..." through "...what we cannot do. Thank you."</i>
Watch for	If WebGPU is unavailable it says so plainly — that's a graceful degrade, not a failure. Skip to the close.

If you have 60 seconds spare

In priority order — the first is the best drama available:

1. **Kill quorum live.** FLEET → **STOP** on two nodes. The whole gate slams to BLOCKED and the signal bar goes red.

"Flight Rule eight — operator quorum — is non-negotiable. I have just removed this system's authority to act, in four seconds. Restart them, and it recovers."

2. **Recourse.** In the **HOW** panel, an unresolved step has acquisition buttons with costs.

"The gate doesn't just report what's missing. It computes the cheapest set of measurements that would clear it — and verifies no smaller set works."

3. **The autonomous agent.** MISSION → **ACTIVATE**, then watch the feed.

"It plans a real manoeuvre, then submits itself to the same gate a human faces — and stands down when it's refused."

4. **Decision receipts.** Bottom of the **HOW** panel.

"Every decision emits a hash-chained receipt that replays byte-for-byte. Change one input and the hash changes."

Round 1 — name it, don't demo it

One breath, anywhere convenient. It's all visible behind everything anyway:

"Everything from Round 1 is still here — the thirty-one thousand object catalogue, the screening, the avoidance planner that checks a new orbit against the whole catalogue, the launch-window planner, multi-operator consensus, and the mission-control chat. Round 2 put a gate in front of every irreversible thing it can do."

Recording notes

- **One take per scene** beats one take overall. Cut between scenes; nobody minds.
- **Don't narrate the clicking.** "Now I'll click on..." is dead air. Click, then speak to what appeared.
- **When the gate refuses, do not apologise.** That is the product working. Slow down there.
- **Never say "formally verified" unqualified.** Say what was checked and to what bounds.
- **Have the recorded fallback cued** — demo/astromesh-round2.mp4. Every judging post-mortem says the same thing: a stalled live demo is the top killer.
