

AstroMesh — shot list

Pairs with NARRATION.md. Seven scenes, about two and a half minutes.

Pre-flight

1. Gateway and frontend running.
 2. Browser **1600×900**, zoom **100%**, bookmarks hidden.
 3. Open **HOW** once, then close it — warms the corridor and ground layers.
 4. Open **FILTERS**, tick *Show all tracked objects*, wait, untick — warms the GPU screen.
 5. Reload for a clean boot.
 6. One dry run **with wifi off**.
-

1 · Open — 0:00

Do nothing; let the boot and fly-in play. **Screen** globe right, **BLOCKED** 44% left. **Watch** don't talk over the boot bar.

2 · The refusal — 0:15

Do **RISK** → **VOTE** on the top card. **Screen** toast **OPERATOR VOTE REFUSED**; rulebook fills with red ✕ and grey ○ rows. **Point at** the **FR-07** row and its **NO OVERRIDE** tag, then the grey rows. **Watch** if the top card holds a commandable object the reason differs — **read the screen**, not the script. The point holds either way.

The thesis scene. Slow down here.

3 · The chain — 0:45

Do **HOW**. Globe flies to the corridor. Scroll the panel at reading speed. **Screen** red ribbon Spain → India, **DINOv3** ground strip, 12 numbered steps. **Pause on** step 3 (density), 5 (**DINOv3**), 8 (**Ec 19.7×**), **9 (the DAS comparison)**. **Watch** if you cut anything in the film, not step 9.

4 · Ride it down — 1:25

Do ▶ **FOLLOW DESCENT**, ~12 s. Optionally ¼× over land. Then ✕ **STOP**. **Screen** camera falls with the stage; HUD counts altitude, flight-path angle, downrange. **Watch** say the "kinematic replay" line while that caption is visible.

5 · The storm — 1:50

Do STORMS → ⚡ **REPLAY GANNON**. Then **LIVE** to restore. **Screen** three bands paint; header Kp 9 · G5; 3/8 ground stations reachable; map key bottom-left. **Point at** the station count, then the key. **Watch** the LIVE restore is worth two seconds — the before/after sells it.

6 · Theme independence — 2:10

Do STORMS → scroll to **THEME INDEPENDENCE** → **PROVE IT**. **Screen** five release-gate scenarios, all four badges, engine changes required: 0. **Watch** aircraft dispatch is API-side. Mention only if asked; don't hunt for it on camera.

7 · GPU and close — 2:25

Do FILTERS → ⚡ **GPU SCREEN**. Close filters. **HOW** to end on the signal. **Screen** objects, pairs, milliseconds, pair-checks per second; candidate lines flash. **Watch** no WebGPU means it says so plainly — skip to the close, that's a graceful degrade.

Spare 60 seconds

1. **Kill quorum. FLEET** → **STOP** two nodes. Gate slams to **BLOCKED**. *"Flight Rule eight is non-negotiable. I just removed this system's authority in four seconds."*
2. **Recourse**. In **HOW**, an unresolved step's acquisition buttons. *"It computes the cheapest set of measurements that would clear this — and verifies no smaller set works."*
3. **Agent. MISSION** → **ACTIVATE**, watch the feed. *"It plans a real manoeuvre, then submits itself to the same gate — and stands down when refused."*
4. **Receipts**. Bottom of **HOW**. *"Hash-chained, replays byte-for-byte. Change one input and the hash changes."*

Round 1 — one breath, anywhere

"Everything from Round 1 is still here — the catalogue, the screening, the avoidance planner, launch windows, multi-operator consensus, the mission-control chat. Round 2 put a gate in front of every irreversible thing it can do."

Notes

- One take **per scene**. Cut between them.
- Don't narrate clicking. Click, then speak to what appeared.
- When the gate refuses, **don't apologise** — that is the product working.

- Never say "formally verified" unqualified. Say what was checked, to what bounds.
- Keep demo/astromesh-round2.mp4 cued as the fallback.
